ALCOHOL IDENTIFICATION AND BRIEF ADVICE (IBA)

Your health challenge

- 6,490 alcohol-related deaths in England in 2012¹
- 19% increase in alcohol-related deaths since 2001¹
- 1m+ hospital admissions related to alcohol in 2012-13³
- £3.5bn annual NHS spend on alcohol-related conditions¹

Fact: Only 6.4% of dependent drinkers access treatment in the UK¹

How can community pharmacies help?

Pharmacy teams can offer alcohol interventions and screening services using accredited tools such as AUDIT-C to assess drinking in a wide range of patient and demographic groups.

Where problem drinking is identified this can be followed by advice and follow up, support materials or referral to local specialist alcohol teams.

Results from pharmacy services and campaigns in the past have included:

- Four out of every 10 customers who took part in a risk assessment service recorded a score which indicated higher risk drinking²
- More than 60% of service users cut back on the number of alcohol units they drank afterwards³
- 52% said pharmacy kits helped them to reduce the number of days they drank on³
- Four in five said they had started keeping better track of their drinking³
- Mean Audit-C results reduced in some service users⁴
- 100% of service users were comfortable talking about alcohol in pharmacies⁵

What the experts say

Those interviewed perceived the service to be informative and a good idea, particularly for individuals drinking at higher risk levels. A number of respondents also reported an increased awareness of units in different drinks and recommended limits, and of other lifestyle services offered at the pharmacy.

Service Evaluators – Wirral³

“This kind of informal approach is so different to what GPs do.”

Potential benefits of a community pharmacy alcohol intervention service

1. Reduce harmful drinking in your local population
Pharmacy alcohol campaigns have been shown to lead to behaviour changes in some people accessing them with reductions in drinking seen. This would have health benefits, and may lead to fewer people living with preventable ill health or dying prematurely from alcohol-related conditions.

2. Reduce pressure on GPs, A&E and other healthcare providers
Sometimes people who are worried about their alcohol consumption visit their GPs; so if receptionists could refer them to local pharmacists this may ease pressure on practices. Perhaps more importantly, with a plan in place to manage their alcohol intake, fewer people will end up with alcohol-related complications and health problems, reducing both pressure on practices and on A&E and hospital services.

3. Save NHS money and resources
If alcohol dependence and harmful drinking can be reduced in people accessing this service then those people are likely to have fewer alcohol-related complications which reduces future NHS spend on services.

Fact: for every £1 invested in specialist alcohol treatment, £5 is saved on health, welfare and crime costs.1

4 Target hard-to-reach drinking groups
Community pharmacies are accessible to vulnerable patients and populations, with many located in deprived areas and communities. This means they can more easily access some groups of people. Pharmacy teams may also come into contact with people who are not registered with GP practices or accessing other health services.

How might your local service work?
Trained pharmacy teams can offer a variety of alcohol interventions and screening services using accredited tools such as AUDIT-C to assess drinking. Screening can begin with quizzes or scratch cards to help engage people in a less formal way.

The service could target as many people as possible, or focus on specific groups such as men and women aged 18-30 years, or people with diabetes. Commissioners are advised to think broadly though as alcohol support can be needed in all areas and groups of people.

Where problem drinking is identified, pharmacy teams can offer people advice and support as appropriate. It is estimated that for every 8 people in the higher risk levels who receive advice on their alcohol consumption, one person will reduce their drinking to a much lower level as a result.7
